ABSTRACT

A method of playing an optical disc in an optical disc player is provided, which includes detecting a playing status of the optical disc player as a normal playing status or an abnormal playing status and if the playing status is detected as abnormal, then searching a URL list stored on the optical disc in response to the search command to identify a URL in the URL list which provides a link to information which is required to be downloaded for normal play of content of the optical disc, but which has not yet been downloaded, and accessing one or more URLs identified during the search to download the information that is required in the normal playing status only while the player is detected to be in the abnormal playing status.
